## THE NATIONAL ENVIRONMENT MANAGEMENT AUTHORITY

## ENVIRONMENTAL IMPACT ASSESSMENT STUDY REPORT FOR THE PROPOSED DUALLING OF MOMBASA-MARIAKANI ROAD, MOMBASA COUNTY

## INVITATION OF PUBLIC COMMENTS

PURSUANT to regulation 21 of the Environmental Management and Co-ordination (Impact Assessment and Audit) Regulations, 2003, the National Environment Management Authority (NEMA) has received an Environmental Impact Assessment Study Report for the above proposed project.

The proponent (Kenya National Highway) is proposing to dual Mombasa-Mariakani (A109) Road, Mombasa County.

The project road is approximately 41 km. and forms part of the 500 kilometres Mombasa-Nairobi Highway. The project road starts at the junction of Kenyatta Avenue (A109) and Digo Road (A14) within Mombasa City. It runs in a northerly direction through Changamwe, Miritini, Mazeras, Mariakani, before terminating at Mariakani Weighbridge. The proposed rehabilitation and expansion of Mombasa-Mariakani Road is a national flagship under the Kenya Vision 2030 and has economic benefits to the country as well as the immediate neighbouring states (Uganda, Sudan, Rwanda and to some extent Burundi). At the local level, the road expansion will address the persistent traffic congestion between Miritini and the City Centre (where at time it runs into hours) through streamlining the flow of heavy traffic.

The following are the anticipated impacts and proposed mitigation measures:

Impacts	Mitigation measures
Degradation of water sources	<ul style="list-style-type: none"> <li>• Ensure valid permits on construction water abstraction (sources established in Kokotoni and Mwache areas).</li> <li>• Groundwater abstraction be on permits conditions (locations to be identified).</li> <li>• Ensure the public at target water sources gets priority on surface water sources.</li> </ul>
Air quality	<ul style="list-style-type: none"> <li>• Ensure deviations and dry materials are kept damp at all times.</li> <li>• Extraction Materials to be under damp conditions.</li> <li>• Establish information flow process to the communities on dusty conditions.</li> <li>• Material delivery trucks to comply with established emission standards.</li> <li>• Undertake sampling for air quality in 4No. Pre-identified locations every 6 months for monitoring purposes.</li> <li>• Utilization of Non Motorized Transport provisions for public safety.</li> </ul>

  - Properly designed spill containment systems at product storage areas to minimize the volume of storm water that becomes intermingled with contaminants within the containment system.
  - Effluent from separator should be treated to meet the NEMA prescribed standards for waste water before discharge into public storm water drainage.
  - Oil separator compartments should be cleaned regularly and the sludge properly disposed off to a registered and licensed NEMA waste collector.
- Contamination of soil and ground water sources in case of accidental spillages**
- Automated Leak Detection System should be installed in the terminal to aid identification of leakages and stopping escaping vapour emissions.
  - The contractor, should ensure that the tanks and the domes comply with API

650 in terms of assemblage of construction equipment and installation; specifically sections G.4.2.1, G.4.2.2, G.1.1 and 1.4.1 and ensure all the tanks are tested before commissioning.

- Develop a comprehensive spill response action plan with other oil marketers and display it in a strategic place.
  - Ensure that all drainages are fitted with oil interceptors to retain any oils that will find their ways into the drainages.
  - Future groundwater sampling should be done to monitor and address any contamination.
  - Future Soil Gas Survey and sampling should be carried out periodically once the project becomes operational to ensure there is no contamination as a result of project activities.
- Security risk**
- KPC should come up with a strategy of controlling public movement along the above mentioned public road.
  - Security should be boosted around the tanks especially to monitor the activities happening after the security wall fence after the proposed tanks within a radius of 500m from the project site.
- Fire hazards**
- All permits be acquired before any welding or cutting work commences near live tanks or in areas considered to hold considerable fuel vapour.
  - Carry out pre-incident response planning to identify hazards, a fire's potential to develop into a major incident and the required and available resources.
  - Ignition from hot work will be controlled by following established hot work permit procedures.
  - An integrated fire prevention plan will be drafted before "start-up" of the facilities.
  - Ignition from electrical equipment will be prevented by:
    - Following appropriate electrical standards.
    - Assuring that equipments are in good operating condition, properly installed and suitable for area's electrical hazard classification.
  - Proper Tank spacing as part of the design to minimize fire hazard and the exposure risk to adjacent tanks, equipment, and buildings if a fire occurs as indicated in NFPA 30 Table 4.3.2.1.1 (a) and Table 4.3.2.1.1 (b).
  - Bund wall and floor construction and penetration joints will be leak-tight. Surfaces should be free from any cracks, discontinuities and joint failures that may allow relatively unhindered liquid trans-boundary migration. As a priority, bunds will be checked and any damage or disrepair, which may render the structure less than leak-tight, will be remedied.
  - Site-specific planning of firewater management and control measures should be undertaken with active participation of the local Fire and Rescue Service team.
  - Appropriate and portable fire extinguishers will be availed at or near places of which fires are likely to occur. The fire extinguishing systems will

comply with requirements of NFPA 10 section 5.4.

- Comply with NFPA 30 section 4.5.4 and 4.5.5 on Management of fire hazards and control.
- Staff working at the facility will be trained in fire systems activation as well as operational procedures. This will also include fire drills.
- The fire detection system will be designed and installed at the terminal during its operation to activate automatically manually or both (automatic with manual activation).
- Arrangements for on-site emergency response and firefighting planning and preparations are drawn up. It will detail the following:
  - Actions and responsibilities of employees in reporting a fire.
  - Responsibilities and actions to be taken to control vapors and prevent ignition of vapors resulting from spills.
  - Actions and procedures to be taken in fighting fires both manually and by activation and deactivation of fixed systems.
  - Notification of appropriate emergency authorities.
- Maintaining integrity of storage tanks and piping systems containing flammable or combustible liquids essential for prevention of fires in around tanks.
- Hydrocarbon and smoke detectors should be installed and automated to act as warning systems in case of any leakages from the fuel tanks or any smoke from live fires that may trigger fire outbreaks.
- Emergency contacts for hospitals, ambulances, firefighting department should be availed at strategic places.
- Capacity building and public awareness should be done extensively to ensure that the workers and the public are aware on how to conduct themselves in case of a fire outbreak.
